“The competent programmer is fully aware of the strictly limited size of his own skull; therefore he approaches the programming task in full humility, and among other things he avoids clever tricks like the plague.

– Edsger Dijkstra
Peer Reviews

- **Anti-Patterns:**
  - No peer reviews
  - Reviews too informal/too fast
  - Reviews find <50% of all bugs

- **Fresh eyes find defects**
  - Code and other document benefit from a second (and third) set of eyes
  - Peer reviews find more bugs/$ than testing
    - And, they find them earlier when bugs are cheaper to fix
  - Everything written down can benefit from a review

Most Effective Quality Practices

Ranked by defect removal effectiveness in percent defects detectable at that stage that are removed. “*” means exceptionally productive technique (more than 750+ function points/month)

- * 87% static code analysis (“lint” tools, compiler warnings)
- 85% design inspection
- 85% code inspection
- 82% Quality Function Deployment (requirements analysis)
- 80% test plan inspection
- 78% test script inspection
- * 77% document review (other documents)
- 75% pair programming (informal on-the-fly review)
- 70% bug repair inspection
- * 65% usability testing
- 50% subroutine testing (unit test)
- * 45% SQA (Software Quality Assurance) review
- * 40% acceptance testing
Peer Reviews Are Effective + Efficient

Defect Removal by Phase - Typical Project from 5 years earlier

- No reviews, no unit test, no integration test, ...
- Most bugs found in system test!

5 years later...

Defect Removal by Phase With Peer Reviews

- Found more bugs total
- Almost no bugs left in system test!

- Found many bugs up front, where fixes are cheaper

[Source: Roger G., Aug. 2005]
Gold Standard: Fagan Style Inspections

- Methodical, in-person review meetings
  - Pre-meeting familiarity with project
  - Producer explains item then leaves
  - Moderator keeps things moving
  - Reader (not author) summarizes as you go
  - Reviewers go over every line, using checklists (perspective-based)
  - Recorder takes written notes
  - Result: written list of defects. The Producer fixes code off-line
  - Re-inspection if the defect rate was too high

- Methodical reviews are the most cost effective
  - Important to measure bug discovery rate to ensure review quality
Rules for Successful Peer Reviews

- Inspect the item, not the author
  - Don’t attack the author.

- Don’t get defensive
  - Nobody writes perfect code. Get over it.

- Find but don’t fix problems
  - Don’t try to fix them; just identify them.

- Limit meetings to two hours
  - People are less productive after that point.

- Keep a reasonable pace
  - About 150 lines of code (or equivalent) per hour. Too fast and too slow are both bad.

- Avoid “religious” debates on style
  - Enforce conformance to your style guide. No debates on whether style guide is correct.

- Inspect, early, often, and as formally as you can
  - Keep records to document value (might take a while to mature).
# Example Light-Weight Review Report

## Peer Review Template for Project X

<table>
<thead>
<tr>
<th>Date</th>
<th>4/17/2011</th>

<td></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td></td>
<td></td>
</tr>
<tr>
<td>8</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Status Key:**
- Fixed (trivial fix by author; no need to enter in defect list)
- Bugzilla (entered into project defect system)
- Not a Bug (false alarm)

Just enter “fixed” if fixed within 24 hours.

Perspective-Based Peer Reviews

- Perspective-based Peer Reviews are 35% more effective
  [https://www.cs.umd.edu/projects/SoftEng/ESEG/papers/82.78.pdf]

- Mechanics of a Perspective-based review
  - Divide a peer review checklist into three sections
  - Assign each participant a different section of the checklist
    - OK to notice other things, but primary responsibility is that section
    - Multiple sets of eyes + perspective breadth

- Example perspectives for a review:
  - Control flow issues
  - Data handling issues
  - Style issues
### Peer Review Checklist: Embedded C Code

#### Before Review:
- 0 ___ Code compiles clean with extensive warning checks (e.g. MISRA C rules)

#### Reviewer #1:
- __ ______
- __ ______
- __ ______
- __ ______
- __ ______
- __ ______
- __ ______

#### Reviewer #2:
- 8 ___ Single point
- 9 ___ Loop entry
- 10 ___ Conditional
- 11 ___ All functions
- 12 ___ Use const
- 13 ___ Avoid use of
- 14 ___ Strong typing
- 15 ___ All variables

#### Reviewer #3:
- 16 ___ Minimum scope for all functions and variables; essentially no globals
- 17 ___ Concurrency (locking, volatile keyword, minimize blocking time)
- 18 ___ Input parameter checking (style, completeness)
- 19 ___ Error handling for function returns
- 20 ___ Handle null pointers, division by zero, null strings, boundary conditions
- 21 ___ Floating point issues (equality, NaN, INF, roundoff); use of fixed point
- 22 ___ Buffer overflow safety (bound checking, avoid unsafe string operations)

#### All Reviewers
- 23 ___ Does the code match the detailed design (correct functionality)?
- 24 ___ Is the code as simple, obvious, and easy to review as possible?

*For TWO Reviewers assign items: Reviewer#1: 1-11; 23-24  Reviewer#2: 12-24*
Before The Spreadsheet (Ineffective Reviews)

Spring 2010 18-649 Student Hours

- **Median**
- **Mean**
- **12 Hrs/Wk**

Average Median = 12.9
Average Mean = 13.4

Week #

- 0: First Two Weeks Summed
- 2: 90%
- 6: 10%
- 8: Spring Break Week
- 10: Finals Week (Zero hrs)
After Spreadsheet & Weekly Defect Reporting

Spring 2011 18-649 Student Hours

Average Median = 13.0
Average Mean = 13.8
Review More Than Just The Code

LEGEND:

Artifacts

To Peer Review

Static Analysis
Peer reviews provide **more eyeballs to find bugs in an affordable way**

- Good embedded coding rate is **1-2 lines of code/person-hr**
  - (Across entire project, including reqts, test, etc.)
- A person can review **50-100 times faster than they can write code**
  - If you have 4 people reviewing, that is still >10x faster than writing!
- How much does peer review cost?
  - 4 people * 100-200 lines of code reviewed per hour
  - E.g., 300 lines; 4 people; 2 hrs review+1 hr prep = **25 LOC/person-hr**
- **Reviews are only about 5%-10% of your project cost**

**Good peer reviews find at least half the bugs!**

- And they find them early, so total project cost can be reduced

**Why is it folks say they don’t have time to do peer reviews?**
Peer Review Best Practices

- Formal reviews (inspections) optimize bugs/$
  - **Target 10% of project effort to find 50% of bugs**
    - You can review 100x faster than write code; it’s cheap
  - Review everything written down, not just code
  - Use a perspective-based checklist to find more bugs

- Review pitfalls
  - If your reviews find <50% of defects, they are **BROKEN**
    - The 80/20 rule does NOT apply to review formality! Formal reviews are best.
    - You can’t review at end; need to review throughout project

- Review tools
  - On-line review tools are OK, but not a substitute for in-person meeting
  - Static analysis tools are great – but not a review!
YOUR CODE LOOKS LIKE SONG LYRICS WRITTEN USING ONLY THE STUFF THAT COMES AFTER THE QUESTION MARK IN A URL.

SORRY.

IT'S LIKE A JSON TABLE OF MODEL NUMBERS FOR FLASHLIGHTS WITH "TACTICAL" IN THEIR NAMES.

LIKE YOU READ TURING'S 1936 PAPER ON COMPUTING AND A PAGE OF JAVASCRIPT EXAMPLE CODE AND GUessed AT EVERYTHING IN BETWEEN.

IT'S LIKE A LEET-SPEAK TRANSLATION OF A MANIFESTO BY A SURVIVALIST CULT LEADER WHO'S FOR SOME REASON OBSESSED WITH MEMORY ALLOCATION.

I CAN GET SOMEONE ELSE TO REVIEW MY CODE.

NOT MORE THAN ONCE, I BET.
